Output The command below prints the content of the file with an unknown extension. ./crack.sh
wtk.rar Q: How to persist the last modified date of each file of type (django) I have a list of files of a known type. I want to persist the last modified date of each of the files. Here is what I have so far. This won't work though, I can't seem to match the file contents to the content type in the line in django's code. from django.core.files.storage import default_storage class MyModel(models.Model): my_field = models.CharField(max_length=100) class fileinfo(models.Model): content_type = models.ForeignKey(ContentType) object_id = models.CharField(max_length=100) file_name = models.CharField(max_length=100) def get_file_info(content_type, object_id, file_name): storage = default_storage() file_info = content_type.objects.get(pk=object_id) file_info_obj = file_info if file_info_obj.exists(): return file_info_obj.file if storage.exists(file_name): file_info.send_mail(user=user, template_name= "file.not_found") log.info("File name %s already exists." % (file_name)) return file_info_obj.file file_info.save() storage.save(file_name, file_info.file.read(), file_info.file.last_modified) return file_info_obj.file A: I was not able to find a way to do it via the Django's native models, so I had to write it all myself. class FileInfo(models.Model): content_type = models.
